About me

I wrote my first line of code at **12** and never really stopped. Since then I've used a lot of languages and tools, enough that picking up a new one isn't a big deal anymore. I just go with whatever suits the problem.

Most of my work is on the **backend**: services, schemas, queues and the integrations that hold everything together. I like the parts nobody sees: the heavy aggregation I moved behind a materialized view, and the pipeline that catches a bug before it ships.

It's not all backend, though. I've worked on the frontend with React and React Native too.

(Data Protection Directive)I hereby give consent for my personal data included in my application to be processed for the purposes of the recruitment process under the European Parliament's and Council of the European Union Regulation on the Protection of Natural Persons as of 27 April 2016, with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC

EXPERIENCE

Senior Fullstack Developer - Widelab development sp. k. (01.2026-now)

*Building a new platform that gives campaigning organizations fine-grained control over ad spend: budgets and live spend tracking at every level, from the whole campaign down to each agency and individual agent, with debit cards issued through Lithic. Working across the stack: **NodeJS**, **NestJS**, **PostgreSQL** and **Redis** on the backend, **React** (Vite, shadcn/ui) on the front, with Sentry and Grafana/Prometheus for observability.*

Backend Developer - Yumzi GmbH (01.2026-04.2026 part time)

*Yumzi turns a restaurant's dishes into professional, print-ready menus with **AI**. As it gained traction, its quickly built Express/JS backend started hitting its limits, so I migrated it to **NestJS/TypeScript** (rewiring the **React** frontend onto the new API) and rebuilt it for its thousands of daily users and the hundreds of menus they generate each day. I reworked the **MongoDB** schema and queries to cut database costs by over 60%, re-integrated its existing **LLM** features (AI menu generation and a support bot) into the new backend, and built automatic, context-aware menu translation with the same models (OpenAI, Anthropic, Grok). Stripe handled subscriptions, **Cloudflare R2** stored menu images, and Workers managed uploads and offloaded heavier jobs from the main service. I set up its **CI/CD** pipeline and Sentry monitoring, and operated it in production.*

Backend Developer - ACE XR, LLC (09.2025-11.2025)

*Ace is a VR pistol-training platform on Meta Quest. I was contracted to help their team migrate the backend off a low-code platform to **NestJS** after it outgrew the old stack. With tens of thousands of registered users and thousands of requests per minute at peak, the rebuild leaned heavily on asynchronous processing, using **SQS** and **S3** to pass events and data between services, and precomputing heavy read paths to clear the main **PostgreSQL** bottleneck. I handled Quest Store subscriptions and account auth through Meta, plus transactional email over **SES**.*

Senior Developer/Tech Lead - HTD Polska Sp. Z O.O. (11.2021-08.2025)

*Nearly four years at a medtech agency serving the US healthcare market, where I joined as a mid-level developer and worked my way up to tech lead. I started on ZUS Health, handling **HL7/FHIR** data in **Go**, then moved to its **GraphQL** service in **TypeScript** when the client pivoted. Later, as a senior fullstack dev, I shipped a **React Native** and **Serverless** health app that turned Apple Watch and Fitbit heart-rate data into detailed reports for physicians, and contributed to its **ISO13485** certification. I finished as tech lead of four experienced engineers, owning the technical direction and scoping work directly with the client, on a **React/NestJS** app that helps insured patients find in-network care nearby; within a month of launch it had a few thousand monthly users and had replaced a costly call-center process. All of it involved **HIPAA**-regulated patient data on **AWS** (**Docker**, **Terraform**, **CI/CD**), monitored with CloudWatch and Grafana; as tech lead I carried the on-call pager and was accountable for uptime.*

Developer, Sysadmin - Smart Soft Solutions (07.2020 - 12.2021)

*I split my time between Linux server administration and application work in **C**, **Python**, **JavaScript** and **Go**, backed by **MySQL**, **PostgreSQL**, **Elasticsearch** and **Redis**. The highlight was a COVID-era hardware project: as one of the*

firmware developers on a Raspberry Pi device that gated building entry behind a temperature check and hand sanitizing, I wrote C for the heavy computation and Python for the rest of the app.

Fullstack developer - WebHott (04.2020 - 07.2020)

*Hotel management application development in **PHP** and **Javascript**.*

Intern devops, developer - Lvlup.pro (07.2019 - 10.2019)

*Server hosting tools development in **Go** and **Python**, linux servers administration*

EDUCATION

Technical university of Łódź, IT (2017 - 2022)

Thesis title: Usage of containers to isolate application runtime environments
